TITLE : MAGNETIC RECORDING MEDIUM AND  
ITS PRODUCTION

ABSTRACT : PURPOSE: To provide the magnetic recording medium which can deal with a slider material having high hardness, has excellent CCS durability and is capable of attaining high-density recording by formation of a carbon protective film to a small film thickness. CONSTITUTION: The hydrogen-contg. carbon protective film 4 is formed by Ar sputtering in a gaseous atmosphere for sputtering into which methane is incorporated. The carbon protective film 4 has a two-layered film structure consisting of a first carbon film 4a which is a lower layer and a second carbon film 4b which is an upper layer. The first carbon film 4a is a high-hardness film having about 25at.% hydrogen content and  $\geq 60$  GPa microhardness. The second carbon film 4b is a film having about 35at.% hydrogen content, about  $\leq 50$  GPa microhardness and resilience. The film thicknesses of the first carbon film 4a and the second carbon film 4b are respectively approximately equalled to about 100.
